Technology Stack

Date	30 September 2026
Team ID	6ab3ec14b5170a9b58b3a658
Project Name	Implement Client Script and UI Policy
Maximum Marks	2 Marks

Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	**Frontend / Client-Side**	ServiceNow Platform UI (Form UI) with client-side JavaScript	The Incident form runs in the browser, so Client Scripts and UI Policies control field behaviour instantly without a server round-trip. Uses the built-in g_form and g_user client APIs.
2	**Backend / Server-Side**	ServiceNow server platform (server-side JavaScript / Glide)	Provides the platform that runs the application and serves the form data. No custom server code was required because the project focuses on client-side logic.
3	**Database / Data Storage**	ServiceNow built-in relational database (Incident table)	Form fields and records are stored in the platform's own tables, so no external database setup is needed and data stays consistent with the form.
4	**Cloud / Hosting / Deployment**	ServiceNow Personal Developer Instance (PDI)	A free, cloud-hosted instance that is always available to build, test and demonstrate the solution without managing servers.
5	**Version Control & CI/CD**	ServiceNow Update Sets and GitHub	Update Sets capture the Client Scripts and UI Policies for safe transfer between instances, while GitHub stores the script files for team collaboration and history.
6	**Third-Party APIs / Other Tools**	No third-party APIs; ServiceNow Script Editor and browser developer tools	No external integration was needed. The script editor is used to write the scripts, and the browser console helps debug and test the client-side behaviour.
