Scalability & Future Plan

Date	30 September 2026
Team ID	6ab3ec14b5170a9b58b3a658
Project Name	Implement Client Script and UI Policy
Maximum Marks	1 Mark

Scalability & Future Plan:

This document outlines how the current project solution can be scaled to handle larger user bases, increased data loads, or extended features in the future. It also captures the team's roadmap for enhancing and evolving the project beyond its current state.

Current System Limitations:

S.No	Limitation	Impact	Priority to Address (High / Medium / Low)
1	Rules apply only to the Incident table.	Change, Problem and Request forms get no mandatory-field rules or validation.	Medium
2	Validation runs only in the browser (Client Scripts and UI Policies).	Records created through imports, integrations, APIs or list edits can bypass the rules and store invalid data.	High
3	Values such as the 10-character limit, the Urgency value and the messages are hardcoded in the scripts.	Any change needs the scripts to be edited, which is harder to maintain and risks errors.	Low

Scalability Plan:

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Rules run in each user's browser, so server load is minimal; tested on a single developer instance with a few users.	Promote the update set to a production instance and test with multiple concurrent users and roles; apply the scripts to more user groups.
2	Data Storage	No custom tables; the existing Incident table is used.	Keep thresholds and messages in system properties or a small

			configuration table; use ServiceNow data archiving for old incidents as volume grows.
3	Performance	Lightweight scripts with no server calls, so forms load quickly.	Use GlideAjax (not GlideRecord) for any lookups; merge overlapping UI Policies and avoid unnecessary onChange triggers.
4	Security	Rules are client-side only and rely on existing user roles for form access.	Add server-side enforcement (Data Policies / Business Rules), protect sensitive fields with ACLs, and review changes before moving them between instances.

Future Roadmap:

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 2	Add server-side Data Policies and Business Rules so the same rules apply to imports, integrations and APIs.	1 - 2 months	Consistent data quality from every entry point.
Phase 3	Extend the UI Policies and Client Scripts to Problem, Change and Service Request forms.	3 - 4 months	Uniform user experience and validation across ITSM modules.
Phase 4	Move thresholds and messages to system properties, add GlideAjax lookups, and add automated tests with the ServiceNow Automated Test Framework.	5 - 6 months	Easier maintenance, better performance and safer releases.
